

Installing RIM Blackberry 8700c Display Screen

Tools used in this guide

- [Metal Spudger](#)
- [T6 Torx Screwdriver](#)

Step 1 - New Battery

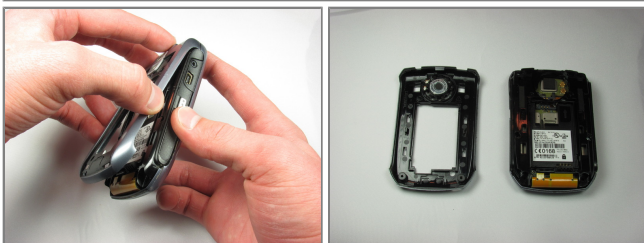

- To begin this installation of a new battery, first remove the back cover by pushing down on the button and sliding the cover towards the bottom of the phone.
- The battery will now be exposed.

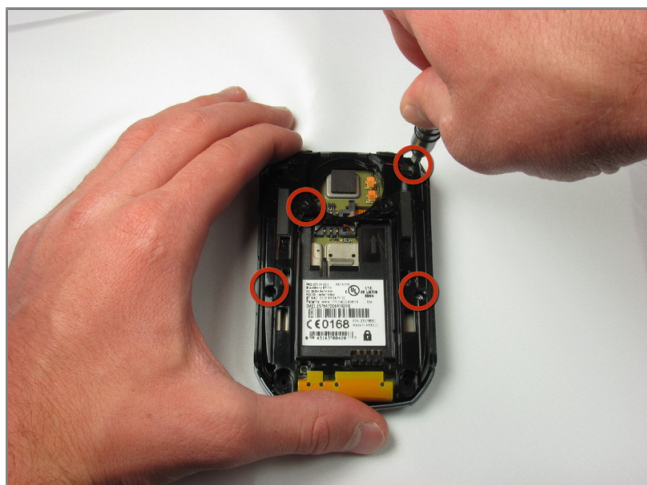

Step 2

- Using your fingernail, pull back on the notch on the top edge of the battery.
- Next place your new battery in the phone by putting the bottom end in first and then pushing it into place.

Step 3 - repair New Keypad

- After removing battery cover and battery, you now need to remove the back cover of the phone.
 - To do this unscrew all four T6 screws
 - Once this is done gently remove the back cover of the phone by pulling first from the bottom towards you, then from the top upwards.

Step 4

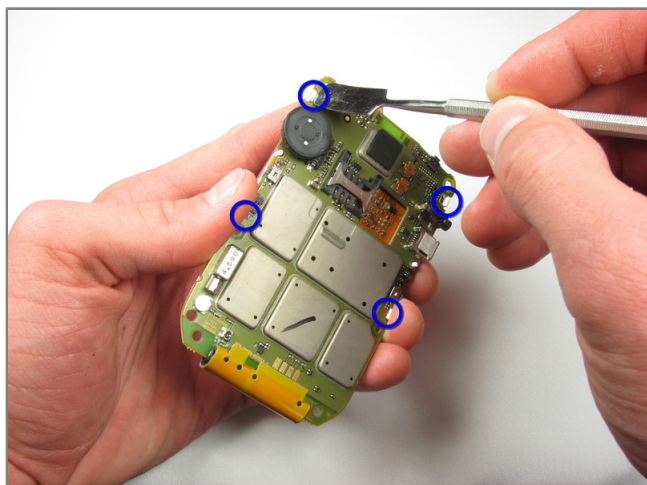

- You will now see the inner back cover of the phone.
 - To remove unscrew the 4 T6 screws
- Once this is done, carefully lift the cover off of the phone. (a small side piece will fall away as well.)

Step 5

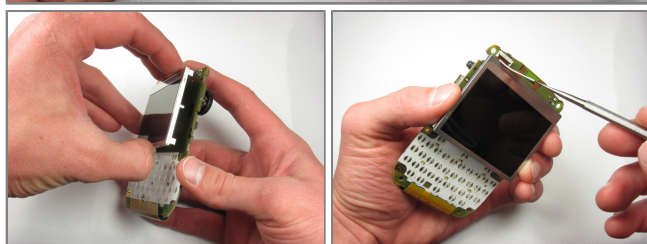

- Once the final 4 screws are removed, you now have access to separate the logic board and from the front cover.
 - To do this, gently lift the logic board from the front cover.

Step 6

- While firmly holding the logic board, use a metal spudger to unclip the four clips holding the screen on.
 - Now gently pull the screen slightly away from the logic board so that none of the clips are engaged on the board.
- Last, use the metal spudger to push back the ribbon cable lock.

Step 7

- The screen is now completely removed and can be replaced.
